

Groff Ag places the fertilizer band 2" to the side and even with seed depth to allow the feeder root from the growing point of the plant to reach the nutrients as quickly as possible. Our studies have shown that for every $\frac{1}{2}$ " you move this band away from the seed, there is an 18 hour lapse in response time from the seed.

With proper planter adjustment, The Groff AG Row Flex Placer always places the fertilizer band in the ideal location. This allows you to place a high percentage salt index starter fertilizer without worrying about burning the seed.
